

RENTAL, EQUIPMENT, SERVICES

**The solution for
any pumping
application.**

AT OUR CUSTOMERS' SIDE SINCE 1988

The largest pump fleet in Italy

Choosing Varisco Wellpoint also means having the most diverse, wide and specialised fleet of rental pumps available on the market.

5600+

CUSTOMERS

1200+

YEARS OF EXPERIENCE
IN THE FIELD

Complete and reliable solutions

Our daily commitment is aimed at studying effective and innovative technical proposals, to provide our customers with the best solutions to groundwater drainage problems encountered during excavation works. The competence of our technicians guarantees a quick and effective answer to our clients' questions which involve aspects relating to the structure, to the procedure's construction and costs of the work.

Rental of pumps and accessories for construction, industry and fire prevention

Our large rental fleet is divided into wellpoint systems and self-priming, submersible, submersed and dredging centrifugal pumps capable of tackling and solving the most complex water problems on construction sites in the best way possible

Consultancy for drainage and wellpoint systems

Varisco Wellpoint has qualified technicians and collaborates with engineers and geologists constantly updated, allowing the study of water filtration even in the most demanding situations.

Turnkey projects

On request Varisco Wellpoint supply the complete assembly of the system with our own site personnel and equipment.

Service and Maintenance

We repair to pumps and, in the case of construction sites long-lasting, it is possible to have a service of scheduled maintenance of the pumps it lifts the user gives this control burden.

Pump test bench

Our pump test bench simulate real conditions of a pumping system, testing and monitoring the operating parameters.

Hydraulic and geological training

We organize training courses about wellpoint and dewatering applications to prepare you to everyday challenges.

Self-priming centrifugal pumps

VAR Series – These pumps are used in applications with a quick self-priming capacity up to a suction lift of 7.5 m. The open impeller allows passage of solids with large diameter.

Submersible pumps

Electric submersible pumps and accessories are designed for an extensive range of dewatering applications. These pumps feature a built-in starter and motor protection system, along with optional automatic level control. Adjustable wear-resistant rubber diffusers and hardened high-chrome impellers ensure durability in tough environments.

Vacuum assisted self priming pumps

PAS and WEL ECO – The vacuum assisted pumps use a vacuum pump to speed up priming, that is, the initial pumping stage where the air must be removed from the suction duct to allow the liquid to reach the pump.

Piston pumps

The WEL range of self-priming, quick and automatic pumps is designed for high flow rate wellpoint applications. The high-performance WEL PST model is suitable for heavy-duty applications that require 24 hours of operation per day and is characterised by its maximum fuel efficiency.

Tank Pump

Vacuum assisted electric pumps designed for the drainage of low-permeability soils (silt, silty-clayey), where the flow rates to be pumped are small, variable and with high air contents.
